

GROUTS FOR TILE JOINTS

Regulation EN 13888

This regulation establishes the test criteria and methods for the classification of grouts for tile joints for ceramics and similar materials. It divides the grouts into 2 categories distinguished by letters of the alphabet:

CG cementitious

Cement-based powder grouts to be mixed with water or an appropriate liquid at the moment of use in the construction site.

RG reactive

Grouts made up of two or more compounds that must be mixed at the moment of use in the construction site.

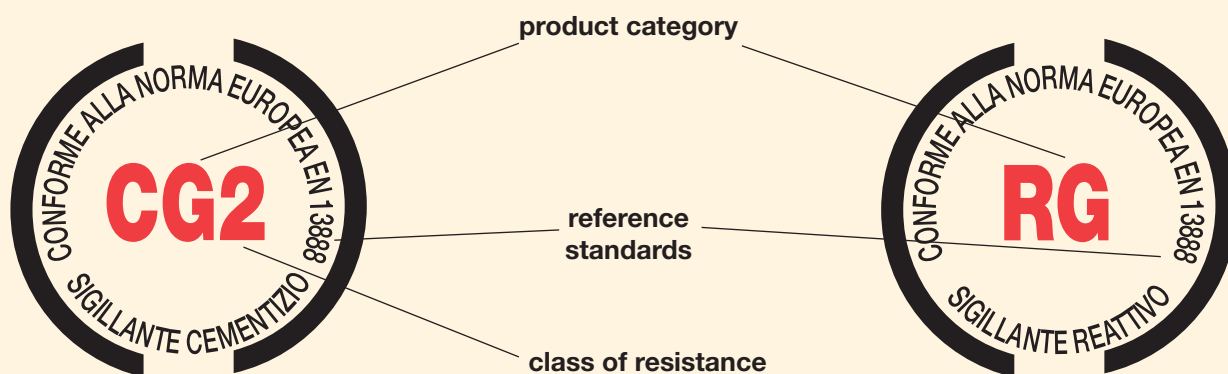

For the products in category *CG*, there are two distinct classifications based on test results:

class 1

Normal grout, which reaches the minimum required levels in all tests.

class 2

Grout with reduced water absorption and high abrasion resistance.

At the moment there is no CE marking for these types of materials.
